dard; protein; 284 AA.

tumour necrosis factor related ligand (TRELL).

necrosis factor related ligand; tnf; treatment; cancer; sease; immune system; stimulation; suppression;

97WO-US013945.

96US-0023541P. 96US-0028515P. 97US-0040820P.

GENEVA FACULTY MEDICINE

he Y, Browning JL;

5619/13.

treating cancer, sis factor related ligand - useful for, e.g. t. disease and immune responses to tissue grafts.

Je 50-51; 69pp; English.

rders in mammals (especially humans), e.g. tumours, and inflammatory diseases or inherited genetic disorders, by into cells, and expressing, therapeutically effective amounts e.g. a virus comprising a gene encoding TRELL. It may also the preparation of prepare probes for screening hetic DNAs for TRELL-encoding sequences and for antisense immune nistered, optionally with interferon- gamma, to induce cell at, suppress or alter immune responses (especially involving a ricinoma cells) involving a signal pathway between TRELL and It's coding sequence can be used in gene therapy for TRELL-LL or active fragments can be included with a carrier in al compositions to treat cancer, autoimmune diseases or sness to tissue grafts, or to stimulate or suppress the immuns useful to screen for TRELL receptors, by labelling with a abel and screening compositions for binding. Agents with TRELL-receptor binding can also be screened for, can is that of human tumour necrosis factor related ligand

Sequence 249 AA;

The present sequence represents a human tumour necrosis factor ('Imphotoxin homologue designated Apo-3 ligand. Apo-3 ligand has cytostatic activity. Apo-3 ligand can be used to induce apoptosi mammalian cancer cells, to induce NF-kappaB-dependent transcript to induce JNK/SAPK-dependent responses in mammalian cells

The present sequence is that of human antitumour protein PRO207, deduced from a foetal kidney cDNA clone (see AAA49717). PRO207 shamino acid sequence identity to tumour necrosis factor family mem emploatially human lymphotoxin-beta (23.4%) and human CD40 ligand (Mol.wt. is 27,216. A claimed method for inhibiting the growth of cell comprises exposing the tumor cell to PRO199, PRO207, PRO320, PRO221, PRO224, PRO328, PRO310, PRO526, PRO362, PRO356, PRO365, PRO595 or (see AAY95337-49), their agoniers or chimeric polypeptides incorp them. The tumour is especially a cancer selected from breast, ovarenly, colorectal, uterine, prostate, lung, bladder and central n system cancer, melanoma and leukaemia. Methods for the recombinan expression of the antitumour proteins are also provided
                                                                                                                                                                                                                           Novel composition to inhibit neoplastic cell growth or for treati. in mammal comprises polypeptides PRO119, PRO207, PRO320, PRO219, PRO224, PRO328, PRO301, PRO526, PRO362, PRO356, PRO360 or PRO866.

The present invention relates to the isolation of novel human PR polypeptides and the polynucleotide sequences encoding them. The polypeptides, agonists, antagonists or anti-PRO antibodies are u treating benign or mailgnant tumours (e.g. renal, kidney, bladde breast, etc), leukaemias and lymphoid malignancies, other disord as neuronal, glial, astrocytal, hypothalamic, glandular, macroph stromal and blastococalic disorders, inflammatory, immune and ang disorders. The polymucleotide sequences are also useful in gene AAUB66128-AAUB6162 represent the human PRO polypeptides of the in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 VABEDQDPSELNPQTEESQDPAPFLNRLVRPRRSAPKGRKTRARRAIAAHYEVHPI

The invention relates to an isolated nucleic acid molecule encodi tumour necrosis factor family ligand. A composition comprising the isolated antibody or its fragment is used for treating an individual decreased level of endokine alpha activity. The endokine polypeptide present in a heterotrimeric complex is used for treat individual having a disorder associated with excessive bone resor individual having a disorder associated with insufficient bone recomprises administering an endokine alpha antagonist, which is the antibody that binds specifically to endokine alpha polypeptide. Tantibody that binds specifically to endokine alpha polypeptide. / that binds specifically to endokine alpha polypeptide. T sequence represents the amino acid sequence of a tumour n factor family ligand

Duclert A, Giordano J; Dumas Milne Edwards J,

WPI; 2000-500381/45. N-PSDB; AAC01271 New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and fo diagnostic, forensic, gene therapy and chromosome mapping procedu

Claim 13; SEQ ID NO 5346; 71pp + Sequence Listing; English.

The present sequence is a polypeptide encoded by one of a large n 5' ESTs derived from mRNAs encoding secreted proteins. The 5' EST prepared from total human RNAs or polyA+ RNAs derived from 30 dif tissues. EST sequences usually correspond mainly to the 3' untran region (UTR) of the mRNA because they are often obtained from olipprimed cDNA libraries. Such ESTs are not well suited for isolating sequences derived from the 5' ends of mRNAs and even in those cas longer cDNA sequences have been obtained, the full 5' UTR is rare included. 5' ESTs are derived from mRNAs with intact 5' ends and therefore be used to obtain full length cDNAs and genomic DNAs. 5' are also used in diagnostic, forensic, gene therapy and chromosom mapping procedures. They are used to obtain upstream regulatory seand to design expression and secretion vectors

The present invention relates to a method of inhibiting skin inflassociated with a skin disorder selected from psoriasis, atopic dermattisis and allergic contact dermattisis, which involves adminia composition containing delipidated and deglycolipidated Mycobac vaccae cells or M. vaccae culture filtrate. The skin disorder to treated may also include alopecia areata, and skin cancers such a cell carcinoma, squamous cell carcinoma and melanoma. The composiacts by inhibiting the Th2 immune response. The present sequence protein described in the exemplification of the invention

erium acnes polypeptides and nucleic acids useful for against and diagnosing infections, especially useful for vulgaris.

EQ ID NO 13058; 1069pp; English.

L, prevention and their associated DNA sequences are used in the proteins and diagnosis of medical conditions caused by e disorders include SAPHO syndrome (synovitis, acne, hypertosis and osteomyelitis), uveitis and endophthalmitis. The also involved in infections of bone, joints and the central em, however it is particularly involved in the inflammatory ciated with acne vulgaris. A method for detecting the absence of P, acnes in a patient comprises contacting a binding agent that binds to the proteins of the invention ing the amount of bound protein in the sample. The may be used as antigens in the production of antibodies P, acnes proteins. These antibodies can be used to expression and activity of P, acnes polypeptides and act P, acnes presence, for example, by a jemus for determining P, acnes presence, for example, by a jemusoschent assay (ELISA). Note: The sequence data for id not form part of the printed specification, but was also in the productive of the printed specification, but was a second of the printed specification, but was a second of the printed specification. WPI; 2003-381789/36. N-PSDB; ACF64481. New Propionibacterium acnes polypeptides and polynucleotides enc polypeptide, useful for diagnosing, preventing or treating acne or for stimulating an immune response specific for a P. acnes  $p_{\rm L}$ 

Example 1; SEQ ID NO 13058; 1481pp; English

The invention relates to an isolated polymucleotide (ACF64435-Ac encoding a Propionibacterium acnes protein. The invention also rencoding a Propionibacterium acnes protein. The invention also repolymucleotides (ABM3524-ABM64536) immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising toolymucleotide of the invention; antibodies against polypeptides invention; fusion proteins comprising a polypeptide of the invention; descend and an isolated T cell population comprising T cells to polymptic and an an isolated T cell population comprising P cells via this method; a vaccine composition (comprising P acnes polypeptides, antibodies, fusion proteins, T cell populations of polymetric cells that express the polympetide); a method for inhibiting the development of P. acnes antipen-presenting cells that express the polympetide; and a method for inhibiting the development of P. acnes patient; and a method for inhibiting the development of P. acnes proteins, T cell populations or antigen-presenting cells that expressions of patient. The P. acnes polympetides, polymcleotides, antibodies, proteins, T cell populations or antigen-presenting cells that collypeptides are useful for diagnosing, preventing or treating a protein. The polymucleotides can also be used as probes or prime nucleic acid hybridisation. The vaccine composition is useful for stimulation of an immune response against P. acnes, or for treat and the kit is useful for performing a diagnostic assay. The presence represents a polympetide predicted to be encoded by an equence represents a polympetide predicted to be encoded by an invention. Note: The sequence data for this patent did not form the brinted specification, but was obtained in electronic format the brinted specification, but was obtained in electronic format.

derived single exon nucleic acid probes useful for analyzing on in human cervical epithelial cells.

Sequence 55 AA;

ID NO 25684; 487pp; English

nvention relates to human single exon nucleic acid probes 110066-AA128459). The present sequence is a peptide encoded robe. The SENPS are derived from human Heida cells. The SENPS o produce a single exon microarray, which can be used for an gene expression in a sample derived from human cervical lls. By measuring gene expression, the probes are therefore ing and/or staging of diseases of the cervix, notably ar. Note: The sequence data for this patent did not form rinted specification, but was obtained in electronic format WIPO at ftp.wipo.int/pub/published\_pct\_sequences

```
The present invention relates to single exon nucleic acid probes measuring human gene expression in a sample derived from human label1535-ABM41305). The present sequence is a protein encoded by probe. The probes may be used for predicting, measuring and dispance expression in samples derived from the human heart via mici By measuring gene expression, the probes are useful for predicting human heart and vascular system e.g. cardiovascular diseases hypertension, cardiac arrhythmias and congenital heart disease. Sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly for the probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         probes which are derived from genomic sequences expressed in the bone marrow. They can be used to measure gene expression in bone samples, which may enable the improved diagnosis and treatment osuch as lymphoma, leukaemia and myeloma. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; bone marrow expressed exon; gene expression analysis; pro

The invention relates to a single exon nucleic acid probe (SENP) measuring human gene expression in a sample derived from human acliver, comprising one of 13109 defined nucleotide sequences giver specification (or complements/ fragments). The probe hybridises a stringency to a nucleic acid molecule expressed in the human adul (I) may be used for predicting, measuring and displaying gene ext in samples derived from human adult liver. The genes identified manning and sequential or second contractions of the second contraction or second contractions of the second contractions of the second contraction or second contractions of the second contraction or second contractions of the second contraction or second contractions of the second contraction of the second contraction or second contractions of the second contraction or second contractions of the second contraction of the second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction or second contraction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia associated with coronary heart disease. ABG47348-ABG5930 repress liver single exon encoded peptides of the invention. Note: The st information for this patent does not appear in the printed specified but was obtained in electronic format directly from WIPO at ftp:wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human genome-derived single exon nucleic acid probes useful for a
                                                                                               Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

JULAR DYNAMICS INC.

Chen W, Rank DR; zel DK,

iressable set of single exon nucleic acid probes, used to expression in human lung samples.

ID NO 35300; 634pp; English.

probes for measuring gene expression in a sample derived ing comprising single exon nucleic acid probes having one of acid sequences mentioned in the specification, or their or the 12387 open reading frames derived from the 12614 included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic ad in the human lung; measuring gene expression in a sample human lung, comprising (a) contacting the array with a detectably labeled nucleic acids derived from human lung measuring the label detectably bound to each probe of the fying exons in a eukaryotic genome, comprising (a)

ly predicting at least one exon from genomic sequences of it and a contacting specific hybridisation of detectably is and (b) detecting specific hybridisation of detectably ic acids from eukaryote lung mRNA, to a single exon probe, ment identical to the predicted exon, the probe is included mentioned microarray; assigning exons to a single exon probe, indentifying exons from genomic sequence by the method measuring the expression of each of the exons in several raying expression of each of the exons in several raying a probe with the exon, where a common pattern of the exons in the tissues and/or cell types indicates that buld be assigned to a single gene; a peptide comprising one iences, mentioned in the specification, or encoded by the reading frames (ORF). The probes are used for gene expression for identifying exons in a gene, particularly using human mRNA, and for the study of lung diseases such as asthma, lung lung diseases such as asthma, lung isease (COPD), interstitial lung , familial idiopathic pulmonary fibrosis, neurofibromatosis, rosis, Gaucher's disease, Niemann-Pick disease, Hermanskywme, marcoidosis, pulmonary haemosiderosis, pulmonary i ymphanary alveolar proteinosis, darome, fibrocystic pulmonary dysplasia, primary ciliary ulmonary hypertension and hyaline membrane disease. The 1 relates to a spatially-addressable set of single exon ic obstructive pulmonary disease (COPD),

Human genome-derived single exon nucleic acid probes useful for gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to human single exon nucleic acid; (SENP: see AA110068-AA128459). The present sequence is a peptide by one such probe. The SENPs are derived from human Hela cells. Can be used to produce a single exon microarray, which can be use measuring human gene expression in a sample derived from human cepithelial cells. By measuring gene expression, the probes are the useful in grading and/or staging of diseases of the cervix, notal cervical cancer. Note: The sequence data for this patent did not part of the printed specification, but was obtained in electronic directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
present sequence is a peptide/protein encoded by a single exon the invention. Note: The sequence data for this patent did not for the printed specification, but was obtained in electronic for directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                      Peptide #8055 encoded by probe for measuring cervical gene expre

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               relates to a single exon nucleic acid probe for measuring pression in a sample derived from human foetal liver. The cleic acid probes may be used for predicting, measuring and expression in samples derived from human fetal liver. The ce is a peptide encoded by a single exon nucleic acid probe on. Note: The sequence data for this patent did not form linted specification, but was obtained in electronic format WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention relates to single exon nucleic acid probes see AA131315-AA157546). The present sequence is a peptide encoded such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples d from human placenta. The probes are useful for antenatal diagnosi human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human genome-derived single exon nucleic acid probes useful for a gene expression in human placenta.

nucleic acid probes for analyzing gene expression in human

ID NO 28660; 530pp; English

nan gene expression in a sample derived from human heart (see 41305). The present sequence is a protein encoded by one such cobes may be used for predicting, measuring and displaying ion in samples derived from the human heart via microarrays. gene expression, the probes are useful for predicting, frading, staging, monitoring and prognosing diseases of the and vascular system e.g. cardiovascular disease, cardiac arrhythmias and congenital hear disease. Note: The 1.for this patent did not form part of the printed in electronic format directly from WIPO int/pub/published\_pct\_sequences invention relates to single exon nucleic acid probes for

```
probes which are derived from genomic sequences expressed in the bone marrow. They can be used to measure gene expression in bone samples, which may enable the improved diagnosis and treatment o such as lymphoma, leukaemia and myeloma. The present sequence is protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                       Human brain expressed single exon probe encoded protein SEQ ID N

probes which are derived from genomic sequences expressed in the brain. They can be used to measure gene expression in brain cell which may enable the diagnosis and improved treatment of nervous diseases such as Alzheimer's disease, multiple sclerosis, schizog epilepsy and cancers. The present sequence is a protein encoded the probes of the invention The present invention provides a number of single exon nucleic

Single exon nucleic acid probes for analyzing gene expression in brains.

ucleic acid detection reagent for detecting 1000 or more sophila and for elucidating cell signaling and cell-cell

10 ID NO 29928; 21pp + Sequence Listing; English.

18 relates to an isolated nucleic acid detection reagent ecting 1000 or more genes from Drosophila. The invention inclosery and in elucidating cell signalling and stactions in higher elucidatings for the development of therapeutics and pharmaceutical drugs. The invention wile DNA sequences (ABL16176-ABL30511), expressed DNA .01840-ABL16175) and the encoded proteins (ABB57737-sequence data for this patent did not form part of the ication, but was obtained in electronic format directly ttp.wipo.int/pub/published\_pct\_sequences

(HUMA-) HUMAN GENOME SCI INC.

Birse CE, Rosen CA;

WPI; 2002-147878/19. N-PSDB; ABQ54751 Isolated nucleic acid molecules encoding novel ovarian polypeptic useful in the prevention, treatment and diagnosis of cancer (e.g cancer), immune disorders, cardiovascular disorders and neurolog: diseases

Claim 11; SEQ ID NO 2806; 2922pp; English.

The invention relates to 2175 novel human ovarian antigens (ABP4. ABP4328) and to CDNAs encoding them (ABD54131-ABQ56305), and all encompasses polypeptides 90% identical and polynucleotides 95% is to the sequences of the invention. The invention additionally recombinant vectors and host cells comprising human ovarian antigens. To polynucleotides, antibodies against human ovarian antigens, and of ovarian antigen polynucleotides and polypeptides in diagnosing treating, prognosing or preventing various ovary and/or breast redisorders. Such conditions include ovarian cancer and breast can metastatic tumours of ovarian or breast origin, reproductive syst disorders (e.g., infertility, disorders of pregnancy, anovulation polyoystic ovary syndrome, ovarian crysts, and dynemorrhoea), encompostations (e.g., infertility, disorders origin, reproductive syst disorders, infections (e.g., champwida, HIV, toxoplasmosis, and shock syndrome), inflammatory conditions (e.g., mastitis, oophor. ovariantis), cardiovascular disorders immunodeficiencies, autoimmune cophorities, systemic lupus erythen blood-related disorders (e.g., anaemia), cardiovascular disorders respiratory disorders, neurological disorders, gastrointestinal cand urinary system disorders, ovarian antigen polypeptides and polymucleotides may also be used in screening for compounds which further he need for general anaemia, cardiovascular programs of the further he need for general anaemia, cardiovascular programs of the further he need for general anaemia, cardiovascular programs of the further he need for general and conservations of the further he need for general and conservations of the further he need for general and conservations of the further he need for general and conservations of the compounds which the compounds which the conservation antigen expression or activity. The polymucleotical cand conservation antigen expression or activity of the polymucleotical cand conservation of the compounds which the conservation of the compounds which the conservation of further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodi useful in disease diagnosis, drug targeting and phenotyping. The sequence represents a human ovarian antigen of the invention. N sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly f at ftp.wipo.int/pub/published\_pct\_sequences

Claim 20; SEQ ID NO 31545; 103pp; English.

The invention relates to isolated polymucleotide (I) and polypept sequences. (I) is useful as hybridisation probes, polymerase that reaction (PCR) primers, oligomers, and for chromosome and gene ma and in recombinant production of (II). The polymucleotides are all in diagnostics as expressed sequence tags for identifying express; genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) useful for generating antibodies against it, detecting or quantit polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical in of sites expressing (II). (I) and (II) are useful for treating di involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in polypeptide and polymucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodical and to produce other types of data and products dependent on DNA amino acid sequences. New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forenaics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess biodiversity. N-PSDB; AAS77578 

Claim 20; SEQ ID NO 43750; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypep sequences. (I) is useful as hybridisation probes, polymerase cha reaction (PCR) primers, oligomers, and for chromosome and gene m and in recombinant production of (II). The polynucleotides are a in diagnostics as expressed sequence tags for identifying expressing enes. (I) is useful in gene therapy techniques to restore norma activity of (II) or to treat disease states involving (II) ? (II) useful for generating antibodies against it, detecting or quantity of supplement. (II) and its binding partners are useful in medical of supplement. (II) and its binding partners are useful in medical of involving abstrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutation and or protein expression of traits to assess biode and contert traits to assess biode and content traits to assess biode and content traits to assess biode and content traits to assess biode and content traits to assess biode and content traits to assess biode and content traits to assess biode and content traits to assess biode and content traits to assess biode and content traits to assess biode and content traits to assess to a content traits and to produce other types of data and products dependent on DNA amino acid sequences. ABG00010-ABG30377 represent novel human di amino acid sequences of the invention. Note: The sequence data for patent did not appear in the printed specification, but was obta electronic format directly from WIPO at the wipo.int/pub/published\_pct\_sequences

This invention, in the area of plant biotechnology, relates to not polynucleotides comprising a nucleotide sequence encoding a prote is involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain and the expressic which is up-regulated during grain filling. The plant is selected corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content coreal grains. In addition, carbohydrate levels may be modified to desirable level using the present invention. Note: The sequence data for this parent did not form part of the printed sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from the plant in the plant in the plant in the plant in the plant in the plant in the plant in the plant in the plant in the plant in the plant in the plant in the plant in the plant is parent of the printed of a fire plant in the plant in the plant is sequenced.

nucleic acid detection reagent for detecting 1000 or more cosophila and for elucidating cell signaling and cell-cell

EQ ID NO 516; 21pp + Sequence Listing; English.

irelates to an isolated nucleic acid detection reagent stecting 1000 or more genes from Drosophila. The invention is relopmental biology and in elucidating cell signalling and eractions in higher eukaryotes for the development of therapeutics and pharmaceutical drugs. The invention nomic DNA sequences (ABL16176-ABL30511), expressed DNA 1001840-ABL16175) and the encoded proteins (ABB57737-ie sequence data for this patent did not form part of the fication, but was obtained in electronic format directly ftp.wipo.int/pub/published\_pct\_sequences

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolor human polynucleotides or a polynucleotide which represents a for derivative or allelic variation of the nucleic acid sequence. Als claimed are a vector comprising the nucleic acid sequence. Als claimed are a vector comprising the nucleic acid sequence. Als claimed are a vector comprising the nucleic acid sequence. Als comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain know a method for identifying an that increases or decreases the expression of the polynucleotide sequence which is differentially expressed in neuronal tissue of a first are expressed in a method for identifying a compound which regulate expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composit method for identifying a compound or small molecule that regulate pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotides or the compound useful in treat polypeptides or their antibodies. The polynucleotide or the compound useful and spared nerve injury (CNII) in an animal (e.g. spinal segmental nerve injury (SNII) in an animal (e.g. get this pared nerve injury (SNII) in an animal (e.g. get the sequence presented is a human protein (shown in Tab the sequence data for this patent did not form part of the printer analytical which is differentially expressed during pain. specification, but was obtained in electronic form directly from ftp.wipo.int/pub/published\_pct\_sequences.

New human protein modification and maintenance molecules and polynucleotides, useful for diagnosing, treating or preventing aut or inflammatory disorders (e.g. AIDS, allergy or anemia), multiple

Claim 1; SEQ ID NO 44; 405pp; English.

sclerosis or cancer.

This invention relates to novel isolated human proteins, which are protein modification and maintenance Molecules (PMMM). The cellula processes regulating modification and maintenance of protein molec coordinate their function, conformation, stabilisation and degrada Each of these processes is mediated by key enzymes or proteins suc kinases, phosphatases, proteases, protease inhibitors, isomerases, transferases and molecular chapterores. Compounds Which modulate the proteins of the invention may have anti-HIV, antiallergic, antiinflammatory, antianaemic, antiatrhinor, antiatrerioscleroric, antiasthmatic, imminicappers anticonvulsant, antiatrerioscleroric, dermatological, antidiabeti nephrotropic, antiparasitic, antihelmintic, antipacriatic, uropat ophthalmological, antirtheumatic, haemostatic, antipacriatic, uropat ophthalmological, antirtheumatic, haemostatic, antipacriatic, uropat ophthalmological, antirtheumatic, haemostatic, antipacriatic, antipacriatic, proteins of the invention may be useful for gene therapy. The huma protein modification and maintenance molecules (PMMMS), the DNA se which encode them and their modulating compounds are useful for diagnosing, treating or preventing disorders associated with aberr expression of PMMM, particularly cell proliferative disorders (for

ē

riosclerosis, hepatitis, polycythaemia vera, psoriasis, mobocytopaenia or cancer), developmental disorders (for mia or mental retardation), neurological disorders (for elimer's disease, Parkinson's disease or epilepsy), nflammatory disorders (for example AIDS, allergies, asthma, hyrolditis, Crohn's disease, diabetes mellitus, storials disease, steoporosis, pancreatitis, Sjogren's syndrome, multiple sclerosis, steoporosis, pancreatitis, Sjogren's syndrome) or microbial The present sequence is the amino acid sequence of a human invention

tides, useful for expressing recombinant proteins for acterization or therapeutic use, or as markers for tissues orresponding protein is preferentially expressed.

ID NO 1541; 1177pp; English

DNA and protein sequences of the invention are useful as: ssues in which the corresponding protein is preferentially molecular weight markers on gels; as chromosome markers or ify chromosomes or to map related gene positions; and to ndogenous DNA sequences in patients to identify potential ers. The present amino acid sequence represents a protein comprises the amino acid and coding sequences of novel

New antisense nucleic acids, useful for identifying proteins or so for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 44629; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any comparisons esquences given in the specification where exproof the 6213 antisense sequences given in the specification where exproof of the nucleic acid inhibits profiferation of a cell. Also include (1) a vector comprising a promoter operably linked to the nucleic nucleic acid, (2) a host cell containing the vector; (3) an isolat polypeptide or its fragment whose expression is inhibited by the antisection or its fragment whose expression is inhibited by the antisection or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity encounted for proliferation, or that inhibits cellular proliferation is into pathway in which a proliferation required gene or its gene product or a gene required for cellular proliferation or the biol contains and the influence of the biol contains and the proliferation of the proliferation of a gene on which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a gene or which the test compound that inhibits proliferation of the proliferatio organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the product is overexpressed or underexpressed; (12) determining the to which each of the strains is present in a culture or collection strains; or (13) identifying the target of a compound that inhibit proliferation of an organism. The antisense nucleic acids are usef identifying proteins or screening for homologous nucleic acids req

```
proliferation to isolate candidate molecules for rational Ty programs, or for screening homologous nucles caids proliferation in cells other than S. aureus, S. typhimurium, e or P. aeruginosa. The present sequence is encoded by one of rokaryotic sesential genes. Note: The sequence data for this of form part of the printed specification, but was obtained c format directly from WIPO at (pub/published_pot_sequences)
